Projective Bundle Theorem in MW-Motives

Nanjun Yang

Tsinghua University

October 9, 2020

Motivation

Suppose 0 i n, we have:

$$H^{i}(\mathbb{RP}^{n}, \mathbb{Z}) = \begin{cases} \mathbb{Z} & \text{if } i = 0 \text{ or } i = n \text{ and } n \text{ is odd} \\ \mathbb{Z}/2\mathbb{Z} & \text{if } i > 0 \text{ is even} \\ 0 & \text{else.} \end{cases}$$

Theorem (Fasel, 2013)

$$\widetilde{CH}^{i}(\mathbb{P}^{n}) = \begin{cases} GW(k) & \text{if } i = 0 \text{ or } i = n \text{ and } n \text{ is odd} \\ \mathbb{Z} & \text{if } i > 0 \text{ is even} \\ 2\mathbb{Z} & \text{else} \end{cases}$$

Motivation

Suppose 0 i n, we have:

$$H^{i}(\mathbb{RP}^{n}, \mathbb{Z}) = \begin{cases} \mathbb{Z} & \text{if } i = 0 \text{ or } i = n \text{ and } n \text{ is odd} \\ \mathbb{Z}/2\mathbb{Z} & \text{if } i > 0 \text{ is even} \\ 0 & \text{else.} \end{cases}$$

Theorem (Fasel, 2013)

$$\widetilde{CH}^{i}(\mathbb{P}^{n}) = \begin{cases} GW(k) & \text{if } i = 0 \text{ or } i = n \text{ and } n \text{ is odd} \\ \mathbb{Z} & \text{if } i > 0 \text{ is even} \\ 2\mathbb{Z} & \text{else} \end{cases}$$

Question

- A motivic explanation?
- How about projective bundles?

Chow Groups

• $CH^n(X) = \mathbb{Z}f$ cycles of codimension ng/rational equivalence:

$$\bigoplus_{y \in X^{(n-1)}} k(y)^* \xrightarrow{div} \bigoplus_{y \in X^{(n)}} Z \longrightarrow 0.$$

$$H$$

$$CH^n(X)$$

• Projective bundle theorem:

$$CH^{n}(P(E)) = \bigoplus_{i=0}^{rk(E)-1} CH^{n-i}(X) \quad P(E) = \bigoplus_{i=0}^{rk(E)-1} X(i)[2i].$$

Chern class:

$$c_i(E) \stackrel{?}{=} CH^i(X).$$

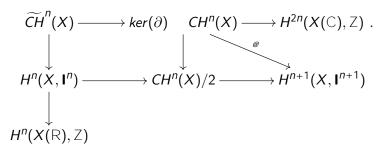

Chow-Witt Groups

Suppose X is smooth and $L \supseteq Pic(X)$. We have the Gersten complex:

$$\bigoplus_{y \in X(n-1)} \mathbf{K}_{1}^{MW}(k(y), L \quad \begin{subarray}{c} *_{y} \\ *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n)} \mathbf{GW}(k(y), L \quad \begin{subarray}{c} *_{y} \\ *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} *_{y} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad \begin{subarray}{c} \\ \hline \end{subarray}} \bigoplus_{y \in X(n+1)} \mathbf{W}(k(y), L \quad$$

Chow-Witt Groups

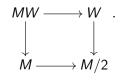

• Suppose *X* is celluar. We have a Cartesian square:

- Pontryagin class
- Bockstein image of Stiefel-Whitney classes
- Orientation class

Four Motivic Theories

• Suppose K = MW, M, W, M/2. We have a homotopy Cartesian:

Definition

Define the category of effective K-motives over S with coefficients in R:

$$DM_{\mathbf{K}}^{e} = D[(X \ A^{1} \ / \ X)^{-1}]$$

where D is the derived category of Nisnevich sheaves with K-transfers.

- **K** = *MW* =) Milnor-Witt Motives
- K = M =) Voevodsky's Motives

Four Motivic Theories

Theorem (BCDFØ, 2020)

For any $X \ge Sm/S$ and $n \ge N$, we have

$$[X, Z(n)[2n]]_{\mathbf{K}} = \widetilde{CH}^{n}(X), CH^{n}(X), CH^{n}(X)/2$$

if K = MW, M, M/2.

Theorem (Cancellation, BCDFØ, 2020)

Suppose S=pt. For any $A,B \supseteq DM_{\mathbf{K}}^e$, we have

$$[A,B]_{\mathbf{K}} \stackrel{\otimes (1)}{\cong} [A(1),B(1)]_{\mathbf{K}}.$$

Basic Calculations

- \bullet $A^n = Z$.
- $G_m = Z Z(1)[1].$
- $\bullet \ \ \land^n \cap 0 = Z \quad \ Z(n)[2n \quad 1].$
- $P^1 = Z Z(1)[2]$.
- $A^n/(A^n \cap 0) = P^n/(P^n \cap pt) = Z(n)[2n].$
- E = X for any A^n -bundle E over X.

Hopf Map η

Definition

The multiplication map $G_m - G_m = G_m$ induces a morphism

$$G_m$$
 G_m ! G_m .

It's the suspension of a (unique) morphism $\eta \supseteq [G_m, 1]$, which is called the Hopf map.

It's also equal, up to a suspension, to the morphism

$$A^2 n 0 ! P^1 (x,y) 7! [x:y]$$

Remark

The $\eta = 0$ if K = M, M/2, but never zero if K = MW, W!

$$\pi_3(S^2) = Z$$
 Hopf

MW-Motive of P^n

Theorem (Y)

Suppose $n \ge N$ and $p : P^n / pt$.

• If n is odd, there is an isomorphism

$$P^{n-(p;c_n^{2i-1};th_{n+1})} R \bigoplus_{i=1}^{\frac{n-1}{2}} cone(\eta)(2i-1)[4i-2] R(n)[2n].$$

2 If n is even, there is an isomorphism

$$P^{n} \stackrel{(p:c_n^{2i-1})}{!} R \bigoplus_{i=1}^{\frac{n}{2}} cone(\eta)(2i-1)[4i-2].$$

Here $th_{n+1} = i_*(1)$ for some rational point $i : pt / P^n$.

$$c_n^{2i-1}: P^n \ / \ cone(\eta)(2i-1)[4i-2]$$

We have
$$cone(\eta) = \mathbb{Z} - \mathbb{Z}(1)[2]$$
 in DM_M^e since $\eta = 0$. This implies
$$[\mathbb{P}^n, cone(\eta)(j)[2j]]_M = CH^j(\mathbb{P}^n) - CH^{j+1}(\mathbb{P}^n).$$

We have an adjunction $\gamma^*: DM_{MW}^e = DM_M^e : \gamma_*$.

Theorem (Y)

Suppose
$$j = 2i$$
 1 n 1. The morphism

is injective with $coker(\gamma^*) = \mathbb{Z}/2\mathbb{Z}$.

Splitness in MW-Motives

Definition

We say $X \supseteq Sm/k$ splits in DM_{MW}^e if it's isomorphic to the form

Goal

Suppose E is a vector bundle. Find out the global definition of c_n^{2i-1} and th_{n+1} on P(E).

Motivic Stable Homotopy Category SH(k)

- spectra of simp. Nis. sheaves q/stable A^1 -equivalences.
- E-cohomologies:

$$[\Sigma^{\infty}X_{+}, E(q)[p]]_{\mathcal{SH}(k)} = E^{p;q}(X).$$

- $H^n(X, \mathbf{K}_n) = H^{2n;n}_{\mathbf{K}}(X) = CH^n(X), \widetilde{CH}^n(X),$ if $E = H / 7 \cdot H \tilde{7}$.
- $(DM_{MW})_{\cap} = SH_{\cap}$.

Motivic Cohomology Spectra

Definition

Every motivic theory corresponds to a spectrum in SH(k), namely

The spectrum represents the $cone(\eta)$ (induces the same cohomologies) of, for example, MW-motive is denoted by $H\widetilde{\mathbb{Z}}/\eta$.

$$H\widetilde{Z}/\eta$$

Theorem (Y)

We have a distinguished triangle

$$P^1 \wedge H Z + H\widetilde{Z}/\eta + H Z + H Z/2[2] + P^1 \wedge H Z[1].$$

Remark

The triangle doesn't split since applying $\pi_2()_0$ we get an exact sequence of Nisnevich sheaves

$$\eta_{MW}^i(X)$$

Definition

$$\eta_{MW}^{i}(X) := [X, cone(\eta)(i)[2i]]_{MW} = [\Sigma^{\infty}X_{+}, H\widetilde{\mathbb{Z}}/\eta(i)[2i]]_{\mathcal{SH}(k)}.$$

Theorem (Y)

If $R = \mathbb{Z}$ and ${}_{2}CH^{i+1}(X) = 0$, we have a natural isomorphism

$$\theta^i: CH^i(X) \quad CH^{i+1}(X) \quad ! \quad \eta^i_{MW}(X).$$

Corollary

If $R = \mathbb{Z}[\frac{1}{2}]$, we have a natural isomorphism

$$\theta^{i}: CH^{i}(X)[\frac{1}{2}] \quad CH^{i+1}(X)[\frac{1}{2}] \quad ! \quad \eta^{i}_{MW}(X)$$

for any $X \ge Sm/k$.

$$a^k, b^k$$

Definition

Suppose n + 1 and k is odd. Define $a^k, b^k \ge Z$ by

$$CH^{k}(\mathbb{P}^{n}) CH^{k+1}(\mathbb{P}^{n})$$
 $!$ $[\mathbb{P}^{n}, cone(\eta)(k)[2k]]_{MW}$ $(a^{k}c_{1}(O(1))^{k}, b^{k}c_{1}(O(1))^{k+1})$ $7!$ c_{n}^{k} .

They are independent of n.

$$c(E)^k : P(E) / cone(\eta)(k)[2k]$$

Definition

Suppose E is a vector bundle of rank n over X, $R = \mathbb{Z}$, ${}_{2}CH^{*}(X) = 0$ and k = n - 2 is odd. Define $c(E)^{k}$ by

$$\begin{array}{cccc} CH^k(\mathbb{P}(E)) & CH^{k+1}(\mathbb{P}(E)) & \stackrel{k}{/} & [\mathbb{P}(E), cone(\eta)(k)[2k]]_{MW} \\ (a^k c_1(O(1))^k, b^k c_1(O(1))^{k+1}) & 7! & c(E)^k \end{array} .$$

If $R = \mathbb{Z}[\frac{1}{2}]$, $c(E)^k$ is defined for all $X \supseteq Sm/k$.

Projective Orientability

Recall SL^c -bundles are vector bundles E over X such that

$$det(E)$$
 2 $2Pic(X)$.

Definition

Let E be an SL^c -bundle with even rank n over X. It's said to be projective orientable if there is an element $th(E) \supseteq \widetilde{CH}^{n-1}(P(E))$ such that for any $x \supseteq X$, there is a neighbourhood U of x such that E_{JU} is trivial and

$$th(E)j_U = p^*th_n,$$

where $p: \mathbb{P}^{n-1}$ U ! \mathbb{P}^{n-1} .

Projective Orientability

- In Chow rings, we can always let $th(E) = c_1(O_{P(E)}(1))^{n-1}$. But this doesn't work for Chow Witt rings!
- If E has a quotient line bundle, it's projective orientable.
- If *E* has a quotient bundle being projective orientable, it's projective orientable.
- Further characterization?

Projective Bundle Theorem

Theorem (Y)

Let E be a vector bundle of rank n over X. Suppose ${}_{2}CH^{*}(X)=0$ and X admits an open covering ${}_{1}GU_{i}$ such that $CH^{j}(U_{i})=0$ for all j>0 and i. Denote by p:P(E) ! X.

• If n is even and E is projective orientable, the morphism $(p, p \quad c(E)^{2i-1}, p \quad th(E))$

$$P(E) / X \bigoplus_{i=1}^{\frac{n}{2}-1} X \quad cone(\eta)(2i \quad 1)[4i \quad 2] \quad X(n \quad 1)[2n \quad 2]$$

is an isomorphism.

If n is odd, there is an isomorphism

$$P(E) \stackrel{(p:p-c(E)^{2i-1})}{\longrightarrow} X \bigoplus_{i=1}^{\frac{n-1}{2}} X \quad cone(\eta)(2i-1)[4i-2].$$

Projective Bundle Theorem

Corollary

Let E is a vector bundle of odd rank n over X. If X is quasi-projective, we have

$$P(E) = X \quad \bigoplus_{i=1}^{\frac{n-1}{2}} X \quad cone(\eta)(2i \quad 1)[4i \quad 2].$$

In particular, we have $(k = minfb\frac{i+1}{2}c, \frac{n-1}{2}g)$

$$\widetilde{CH}^{i}(P(E)) = \widetilde{CH}^{i}(X) \quad \bigoplus_{j=1}^{k} \widetilde{CH}^{i-2j+2}(X \quad P^{2})/\widetilde{CH}^{i-2j+2}(X).$$

Projective Bundle Theorem

Theorem (Y)

Let E be a vector bundle of rank n over X. Suppose $2 \ 2 \ R^{\times}$. Denote by $p: P(E) \ / \ X$. If n is even and E is projective orientable, the morphism $(p, p \ c(E)^{2i-1}, p \ th(E))$

$$P(E) \ / \ X \bigoplus_{i=1}^{\frac{n}{2}-1} X \ cone(\eta)(2i \ 1)[4i \ 2] \ X(n \ 1)[2n \ 2]$$

is an isomorphism.

In particular, we have $(k = minfb\frac{i+1}{2}c, \frac{n}{2} \quad 1g)$

$$\widetilde{CH}^{i}(P(E)) = \widetilde{CH}^{i}(X) \bigoplus_{j=1}^{k} \widetilde{CH}^{i-2j+2}(X P^{2})/\widetilde{CH}^{i-2j+2}(X) \widetilde{CH}^{i-n+1}(X)$$

after inverting 2.

Blow-ups

Theorem (Y)

Suppose Z is smooth and closed in X, $n := codim_X(Z)$ is odd and Z is quasi-projective. We have

$$BI_Z(X) = X$$
 $\bigoplus_{i=1}^{\frac{n-1}{2}} Z$ $cone(\eta)(2i \ 1)[4i \ 2].$

In particular, we have $(k = minfb\frac{i+1}{2}c, \frac{n-1}{2}g)$

$$\widetilde{CH}^{i}(BI_{Z}(X)) = \widetilde{CH}^{i}(X) \bigoplus_{j=1}^{k} \widetilde{CH}^{i-2j+2}(Z \mathbb{P}^{2})/\widetilde{CH}^{i-2j+2}(Z).$$

Thank you!
